

## LIFE CYCLE ASSESSMENT REPORT

### For Type II Environmental Communications

**Reference Product:**

**Picture Light**

**360mm\_Single PCB\_IntegralDriver**

Life Cycle Assessment carried out in compliance with:

PEP Ecopassport PCR-ed4-EN-2021 09 06, supplemented by PSR-0014-ed2.0-EN2023 07 13

EN 50693:2019

EN 15804:2012+A2:2019

Date of issue: 18/06/2026

## 1. General Information

### 1.1. Company Information

Stoane Lighting

20 Dryden Road  
Bilston Glen Industrial Estate  
Loanhead  
EH20 9LZ  
United Kingdom

Website: <https://stoanelighting.com>

Telephone: +44 131 440 1313

Email: [sales@mikestoanelighting.com](mailto:sales@mikestoanelighting.com)

## 1.2. Product Information

**Reference Product** The reference product is one unit of Picture Light\_360mm luminaire produced by Stoane Lighting. The reference product is equipped with 3 LEDs (single PCB) at 3000K, with a (delivered) lumen output of 208.5 lm for a Ledil LISA RS optic and a diffusion filter, equipped with a dimmable control gear typically used with this type of product, specified according to rules in PSR-0014-ed2.0[1]. The technical properties of the reference product are summarised in Table 1.

### Technical Characteristics

Table 1: Technical characteristics of the reference product

	Unit	Values for Picture Light_360mm_SinglePCB_IntegralDriver
<i>Mass (excl. packaging)</i>	kg	1.019
<i>Mass (incl. packaging)</i>	kg	4.619
<i>Assigned lifetime</i>	h	100000
<i>LED light source lifetime (L70B50)</i>	h	60000
<i>Control gear</i>	h	50000
<i>Protection index for water and dust</i>	-	IP20
<i>CRI</i>	-	95
<i>Colour Temperature</i>	K	3000
<i>Light source diameter</i>	mm	1.2 (x3)
<i>Optic option</i>	-	White diffuser + Ledil LISA RS optic
<i>Declared operating voltage</i>	V	2.8 (x3)
<i>Lumen output (initial)</i>	lm	83.0 (x3)
<i>Lumen output (delivered)</i>	lm	69.5 (x3)
<i>Power (light source)</i>	W	0.7 (x3)
<i>Power (luminaire)</i>	W	1.03 (x3)
<i>Luminous efficacy</i>	lm/W	99.3
<i>Light management function</i>	-	External light management system
<i>Energy saving coefficient</i>	-	0.5

**Reference Lifetime** The reference lifetime in years for this product is 20 years, which corresponds to the assigned lifetime of 100000 hours in a scenario where the product is operated for 5000 h/year. This value was selected as it corresponds to the highest available annual operating hours, according to guidelines in PSR-0014-ed2.0 (Table 2).

Table 2: Reference lifetime (years) based on use scenarios in different types of buildings.

Type of building	Annual operating hours (h)	Operational lifetime (years)
<i>Office</i>	2500	40
<i>Educational institution</i>	2000	50
<i>Hotel</i>	5000	20
<i>Catering</i>	2500	40

### 1.3. General information

**Scope** The scope of this report is cradle-to-grave with the addition of Module D, according to definition included in EN15804+A2.

**Product category** According to PSR-0014-ed2.0 the reference product belongs to the LED luminaire category, and it is equipped with an integrated replaceable LED module, for use with external control gear/power supply.

**Declared Unit** The declared unit (DU) is

*To provide lighting that delivers an outgoing artificial luminous flux of 208.5 lumens during a lifetime of 20 years.*

**Functional Unit** The functional unit (FU) defined for comparative purposes applied in this PEP is

*To provide lighting that delivers an outgoing artificial luminous flux of 1000 lumens during a reference lifetime of 35000 hours.*

According to PSR-0014-ed2.0.

**Reference Flow** The following reference flow factor shall be used to convert the impacts from the declared unit level to the functional unit level:

$$\left(\frac{\text{luminous output}_{FU}}{\text{luminous output}_{DU}}\right) \times \left(\frac{\text{lifetime}_{FU}}{\text{lifetime}_{DU}}\right) = \left(\frac{1000 \text{ lm}}{208.5 \text{ lm}}\right) \times \left(\frac{35000 \text{ h}}{100000 \text{ h}}\right) = 1.7$$

### 1.4. Homogeneous family

The reference product represents the “Picture Light” family, which includes products differing based on the length of the extrusion and the mounting bar (and, consequently, the product and packaging mass), the number of PCBs (and, consequently, LEDs), and the type of optic.

These characteristics affect all life cycle stages: the different extrusion lengths require different amounts of aluminium for manufacturing; more packaging is required for heavier products, which also affects the transport impacts and the End-of-Life processes. Longer extrusions can accommodate more LEDs, thus increasing the lumen output and the power of the product.

The reference product contains only one light source PCB (made up of a series of three LEDs), however the Picture Light can be made with two parallel PCB strips, thus doubling the performance of the product.

The criteria and ranges of variation for the homogeneous family are shown in Table 3.

Table 3: Criteria and minimum and maximum values of the ranges of variation for the homogeneous family, reported next to the values associated with the reference product.

Criteria	Unit	Value for the reference product	Minimum value in the family	Maximum value in the family
<i>Length</i>	mm	360	320	1710
<i>Number of LEDs</i>	-	3	3	15
<i>Single/double PCB row</i>	-	Single	Single	Double

This report is valid for all products included in the homogeneous family. The coefficients to be used to extrapolate the impacts for products in the family are reported in section 5.2.

## 2. Material Composition

### 2.1. Product

The materials contained in the product are shown in Table 4. The aluminium parts in the product consist of 75% secondary (post-consumer) material. The product's packaging consists of a wooden crate filled with shredded cardboard, reused by the company from previous shipments of goods.

Table 4: Material composition of the reference product.

Materials	Mass (kg)	Proportion (%)
<b>Metals</b>		
<i>Aluminium</i>	0.493	10.64
<i>Brass</i>	0.041	0.88
<i>Stainless steel</i>	0.016	0.34
<i>Steel</i>	0.001	0.02
<i>Galvanised Steel</i>	0.146	3.15
	<b>0.697</b>	<b>15.03</b>
<b>Plastics</b>		
<i>PET</i>	0.011	0.23
<i>PMMA</i>	0.002	0.04
<i>Acetol Resin</i>	0.040	0.86
<i>PLA Plastic</i>	0.014	0.3
<i>PVC</i>	0.043	0.92
<i>Adhesive</i>	0.003	0.06
	<b>0.113</b>	<b>2.41</b>
<b>Others (electronics)</b>		
<i>PCB</i>	0.016	0.34
<i>Power supply</i>	0.112	2.4

<i>Cardboard for packaging</i>	<b>0.1</b>	<b>2.1</b>
<i>Wooden crate</i>	<b>3.5</b>	<b>75.56</b>
<b>Total</b>	<b>4.632</b>	<b>100</b>

### 3. Life Cycle stages

#### 3.1. Manufacturing

Stoane Lighting sources components and materials from the closest geographical locations possible. Whilst local sourcing is possible for some raw materials, international sourcing is occasionally required especially for electrical/electronic components. Materials and components are processed and assembled at a single factory located in Edinburgh (Scotland). Except for some components (e.g. screws and bolts) which are purchased as finished products, all proprietary parts are manufactured by Stoane Lighting. For the Picture Light, the curved bar hosting the PCB is made out of aluminium extrusion and cut at the desired length. The brace and mounting bar is laser cut of the desired shape.

The factory relies on an energy provider that ensures the provision of electricity from 100% renewable sources; however, for the purpose of this assessment, the electricity has been modelled using the standard Scottish electricity mix (renewable and non-renewable), as shown in Table 5.

Table 5: Average Scottish electricity mix (data from year 2020).

<i>Electricity source</i>	<i>Proportion (%)</i>
<i>electricity production, hydro</i>	11.45
<i>electricity production, wind, offshore</i>	8.75
<i>electricity production, wind, onshore</i>	32.75
<i>electricity production, oil</i>	1.25
<i>electricity production, natural gas</i>	9.85
<i>electricity production, nuclear</i>	29.95
<i>electricity production, photovoltaic</i>	0.85
<i>electricity, from municipal waste incineration</i>	5.15

After manufacturing, the product's finished parts are transported by road using an electric van to local sites for finishing processes, and back to the manufacturing site, ready for final assembly and shipping.

All the manufacturing waste is collected and sent for recycling, except for some of the aluminium waste which is recycled in-house. This process consists of the aluminium waste smelting in an electric forge, which is then cast into a mould to produce new luminaire components.

A scheme representing the main steps of the production processes is shown in Figure 1.

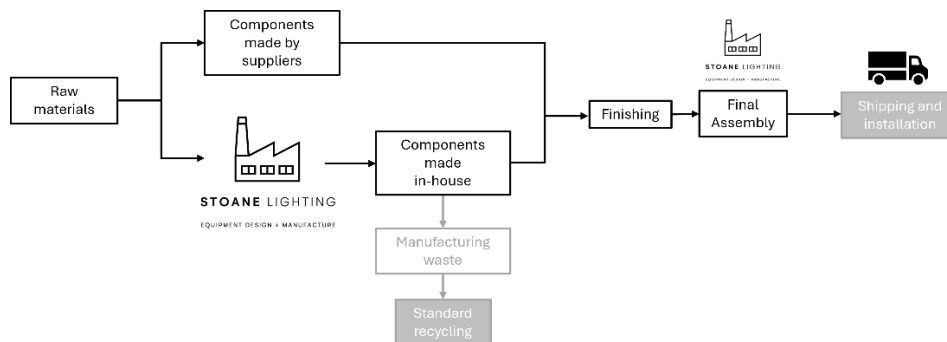

Figure 1: Scheme representing the main steps involved in the sourcing and manufacturing processes before the product is ready to be shipped to the customer.

Packaging associated with materials and components supplied to Stoane Lighting was considered as mostly made up of cardboard boxes, with a small amount of plastic wrapping in the packaging. The packaging mass was estimated as 5% of the total materials mass supplied to the manufacturer. The average composition of the packaging was 90% cardboard boxes and 10% polyethylene film.

### 3.2. Distribution

Stoane lighting manufactures for a global market but a distribution scenario has been created for markets in the United Kingdom (84%) and Europe (16%). This corresponds to an intracontinental distribution scenario according to PEP-PCR-ed4-EN2021 09 06, requiring a distance of 3,500 km travelled by road. Average datasets for transportation by lorry (with average loading, including empty runs) were used to model the distribution stage.

### 3.3. Installation

The installation of the product can be carried out without the use of additional material or energy flows. The output of the installation stage is the disposal of packaging materials; this has been modelled using default values for Europe from PSR-0014-ED2.0- EN-2023 07 13.

### 3.4. Use

The product does not generate direct emissions (B1).

One round of maintenance (B2) has been included to account for one replacement of LED module and control gear (power supply) during the lifetime of the product, as shown in Table 6. This was modelled as taking place at the manufacturing site (Edinburgh), with a like-for-like replacement.

Table 6: Components for replacement during stage B2, with relative mass.

<i>Components for replacement</i>	<b>Mass (kg)</b>
<i>Power supply</i>	0.112
<i>LED Light source</i>	0.001

Repairs (B3), replacements (B4) and refurbishments (B5) are not foreseen. The product does not need to consume water (B7).

Using luminaire consumes electricity (B6); the electricity mix has been calculated with contributions from the average mix in the United Kingdom (84%) and Europe (16%), as shown in Table 7.

Table 7: Data and parameters used to calculate the impact of stage B6.

<i>Datasets</i>	<b>Proportion (%)</b>	<b>Total electricity (kWh)</b>
<i>Market for low voltage electricity – GB mix</i>	84.3	130.4
<i>Market for low voltage electricity – Europe mix</i>	15.7	24.28

### 3.5. End of Life

The waste generated at the End of Life of the product is categorised as Waste from Electrical and Electronic Equipment (WEEE). As the market for this product has been identified as United Kingdom (84%) and Europe (16%), statistics from both regions applicable to WEEE treatment and disposal were used (Recolight, 2021) (Eurostat, 2021), shown in Table 8.

Table 8: Waste treatment rates applicable to luminaire products for United Kingdom and Europe.

<i>Location</i>	<i>Recycling (%)</i>	<i>Incineration (%)</i>	<i>Landfill (%)</i>	<i>Source</i>
<i>United Kingdom</i>	55	20	25	(Recolight, 2021)
<i>Europe</i>	32	3	65	(Eurostat, 2021)

### 3.6. Benefits and Loads beyond the system boundaries

Recycling materials at the End of Life of the product generates benefits by avoiding the production of new raw materials. Benefits have been calculated considering the recycled materials listed in Table 9.

Table 9: Recycled materials used in the calculation of benefits and loads beyond the system boundaries (module D).

<i>Material</i>	<i>Unit</i>	<i>Value</i>
<i>Metals</i>	kg	0.317
<i>Plastics</i>	kg	0.058
<i>Others</i>	kg	0.091

## 4. Environmental Impacts

Software, databases and rules used for the calculation of the environmental impacts of the product are summarised in Table 10; Table 11 gives an overview of the life cycle stages considered in the study, in compliance with PEP-PSR-0014-Ed2.0-EN-2023 07 13.

Table 10: Key information regarding the LCA analysis.

<i>Information</i>	<i>Value</i>
<i>LCA Software</i>	OpenLCA 2.0.0
<i>LCA Database</i>	Ecoinvent 3.10 with EN 15804+A2 add-on
<i>Indicators</i>	Environmental, resource, waste and output according to EN 15804:2012+A2:2019
<i>PCR</i>	PEP-PCR-Ed4-EN-2021 09 06
<i>PSR</i>	PEP-PSR-0014-Ed2.0-EN-2023 07 13
<i>Functional Unit</i>	Provide lighting that delivers an outgoing artificial luminous flux of 1,000 lumens during a reference lifetime of 35,000 hours

Table 11: Life cycle stages considered in the LCA analysis.

<i>Life cycle stage</i>	<i>Meaning</i>	<i>Life cycle stage</i>	<i>Meaning</i>
<i>A1</i>	Material extraction	<i>B2</i>	Maintenance
<i>A2</i>	Transport to factory	<i>B6</i>	Energy in use

<i>A4</i>	Transport to site	<i>D</i>	Benefits and loads beyond End of Life
<i>A5</i>	Installation		

## 4.1. Results per Functional Unit

The following results of the environmental declaration have been developed by considering an outgoing artificial luminous flux of 1000 lumens over a reference lifetime of 35000 hours.

Table 12: Results of environmental impact indicators per Functional Unit.

Indicator	Unit	Total (excl. D)	Prod. (A1-A3)	A1	A2	A3	A4	A5	Use (B1-B7)	B2	B6	C2-C4	D

## 4.2. Results per unit of product

The following results have been developed considering one unit of Picture Light\_360mm\_SinglePCB\_IntegralDriver, with an outgoing artificial luminous flux of 208.5 lm over a reference lifetime of 100000 hours.

Table 14: Results of environmental impact indicators per unit of product (declared unit).

## 5. Extrapolation

### 5.1. Extrapolation rules

Extrapolations rules can be used to establish impacts of other products in the Picture Light homogenous family and have been calculated following PCR-ed4-EN-2021 09 14 and PSR-0014-ed2.0-EN-2023 07 18. The defined rules shall be applied using the information provided in the following tables. The energy saving coefficient is the same across the homogeneous family.

Table 16: Extrapolation parameters of the reference product.

<i>Parameter</i>	<i>Unit</i>	<i>Value for reference product (Picture Light_360mm_SinglePCB_IntegralDriver)</i>
<i>Arm length</i>	mm	360
<i>Product mass</i>	kg	1.019
<i>Packaging mass</i>	kg	3.6
<i>Number of LEDs</i>	-	3
<i>PCB rows – single/double</i>	-	Single
<i>(Delivered) lumen output</i>	lm	208.5
<i>Power</i>	kW	3.1

The coefficients at the product level (declared unit) were calculated using the following formulas:

- For A1-A3 extrapolation coefficients:

$$\frac{\text{Structure weight of concerned product (kg)}}{\text{Structure weight of reference product (kg)}}$$

$$\frac{\text{Packaging weight of concerned product (kg)}}{\text{Packaging weight of reference product (kg)}}$$

$$\frac{\text{Weight of light source of concerned product (kg)}}{\text{Weight of light source of reference product (kg)}}$$

$$\frac{\text{Weight of light source of concerned product (kg)}}{\text{Weight of light source of reference product (kg)}}$$

- For A4 extrapolation coefficients:

$$\frac{\text{Product + Packaging weight of concerned product (kg)}}{\text{Product + Packaging weight of reference product (kg)}}$$

$$\frac{\text{Product + Packaging weight of concerned product (kg)}}{\text{Product + Packaging weight of reference product (kg)}}$$

- For A5 extrapolation coefficients:

$$\frac{\text{Packaging weight of concerned product (kg)}}{\text{Packaging weight of reference product (kg)}}$$

$$\frac{\text{Packaging weight of concerned product (kg)}}{\text{Packaging weight of reference product (kg)}}$$

- For B2 and B6 extrapolation coefficients:

$$\frac{\text{Weight of light source of concerned product (kg)}}{\text{Weight of light source of reference product (kg)}}$$

$$\frac{\text{Weight of light source of concerned product (kg)}}{\text{Weight of light source of reference product (kg)}}$$

$$\frac{\text{Power of concerned product (W)}}{\text{Power of reference product (W)}} \times \frac{\text{Energy saving coefficient of concerned product (-)}}{\text{Energy saving coefficient of reference product (-)}}$$

- For C2-C4 extrapolation coefficients:

$$\frac{\text{Weight of concerned product (kg)}}{\text{Weight of reference product (kg)}}$$

$$\frac{\text{Weight of concerned product (kg)}}{\text{Weight of reference product (kg)}}$$

When multiple factors were contributing to different performance (A1-A3 and B2, B6) the overall extrapolation coefficients were calculated considering the highest resulting coefficient.

The coefficients at the functional unit level were calculated using the formula:

$$\text{Extrapolation coefficient at the product level} \times \frac{\text{Lighting output of reference product (lumen)}}{\text{Lighting output of product concerned (lumen)}}$$

## 5.2. Extrapolation coefficients

The reported extrapolation coefficients are intended to be applied to the production stage (A1-A3), transport (A4), installation (A5), use (B2, B6) and End-of-Life (C2-C4).

Table 17: Calculated extrapolation coefficients for stages A1-A3, A4, A5, B2, B6 and C2-C4, per Functional Unit.

	Arm length (mm)	Coefficients

## 6. Additional Information

Stoane Lighting have carried out life cycle assessment of the reference product and produced this report such that the impacts associated with this product may be understood and information extracted from this report for other calculations by external stakeholders. Stoane lighting recognise both the power of information and the complexity, as such they would be happy to support anyone using this report with, for example: training on extracting relevant data, explanation of impact categories, use of extrapolation for homogenous family calculations, strategies for impact reduction and LCA terminology. Stoane Lighting support the use of life cycle assessment not only as a means for external third-party verified impact communication but also to measure impact and target reductions.

The study underlying this report has been carried out following rules outlined in PCR-ed4-EN-2021 09 14 and PSR-0014-ed2.0- EN-2023 07 18 by program operator PEP Ecopassport. The LCA has not been reviewed by an independent third party, therefore it does not meet the requirements of ISO 14025 for Type III environmental communications (or EPDs). Stoane Lighting would be happy to provide further information on the LCA study and the datasets used to any interested parties.
